

Supply chain resilience:

climate change, food and farming at the MoJ

Problem statement

It is well documented that climate change may pose risks to the UK's food security. Whilst there are contingency measures in place to abate food insecurity, it is worth exploring how prisons can become more self-sufficient and less-reliant on global supply chains by growing their own food, reducing food miles and resultant carbon emissions, as well as becoming more resilient to a changing climate where food supply chains may collapse.

How will climate change impact food growing by Her Majesty's Prison Service?

Challenge question

How will climate change impact food security in prisons?

Potential sub-questions:

- How will climate change affect horticultural activity in prisons?
- Will growing food in prisons become challenging with climate change?
- How can new technologies for food growing help British prisons become more self-sufficient without increasing the amount of land / water or other resources?
- What foods could be a focus in the future in terms of greatest nutritional value for least land use / resource input in line with a changing climate?

Key outputs:

- Literature review with identified gaps to explore further
- Guidance for future policy
- Presentation of the findings

Literature review
